

Municipality of Utrecht

During a demolition and new building project the municipality of Utrecht was confronted with the possibility that the soil might contain remnants of the Second World War. Through the municipality of Tilburg the municipality of Utrecht got in touch with REASeuro.

Sietse Sonsma of the Municipality of Utrecht about REASeuro:

"We joined in with REASeuro since they are capable to execute the preliminary investigations as well as the actual detection. For us this way of working has the considerable advantage that there is only one single contact."

There was a lot of time pressure on this project, because the start of the preparation of the site had been announced already. On a relatively small plot 4 different companies were working simultaneously on soil redevelopment, explosive detection, demolition and preparation of the site for the building activities. Due to this complexity it was a challenge to guide logistics in a correct way. The engagement of REASeuro resulted in the fact that the project did not incur any delay. Furthermore, the budget stayed beyond the bounds.

The co-operation with REASeuro went particularly well. All our questions were always handled in a swift, attentive and alert way. At present REASeuro is still a good interlocutor regarding the subsidy application for this project."
